

LAB 27 - POOR MAN'S REDDIT

Task: Create a webpage that displays the posts from the AWW Subreddit.

Build Specifications:

1. Use a model or a controller to request data from the <https://www.reddit.com/r/aww/.json> API.
2. Display the results on the page.
3. At a minimum, include a title, image and working link for each post. (Easiest is to use the thumbnail for the image, but there are other images in the JSON response.)

Extended Exercise:

- Only show the first ten results.
- Write code to search for other Reddit APIs (**Hint:** They all have the same structure)
- Write Validation for whether a subreddit exists or no when searched
- Use Some CSS to pretty up the page, either the built in bootstrap or your own CSS
